

Approach to Solve E&O Reporting

Step 1: Data Consolidation

Combine monthly E&O data from all entities (countries) into a single table. Load the dimension tables (Entity Mapping, Calendar, Product Hierarchy) to enrich the data with region, country, and product details.

Step 2: Data Transformation

Separate the consolidated data into two categories: Excess and Obsolete. Create a table with all records standardized in one format, including Entity Code, Period, SKU, Quantity, Value, and Type.

Step 3: Data Aggregation

Group the fact table by different dimensions:

- By Period
- By Region
- By Country
- By Business Unit
- By Type

Step 4: Dashboard Creation

Build an interactive dashboard with:

- Slicers to filter by Period, Region, Type
- KPI cards showing total quantities and values
- Charts for visual trends
- Comparison table for period-over-period analysis

Step 5: Report Documentation

Document the approach, methodology, and findings in a comprehensive report explaining the data handling process and dashboard design.
